Load Required Packages

```
library(tidyverse)
library(kableExtra)
library(readr)
library(gridExtra)
library(knitr)
```

```
knitr::include_graphics(path = "QBS181_1.png")
```

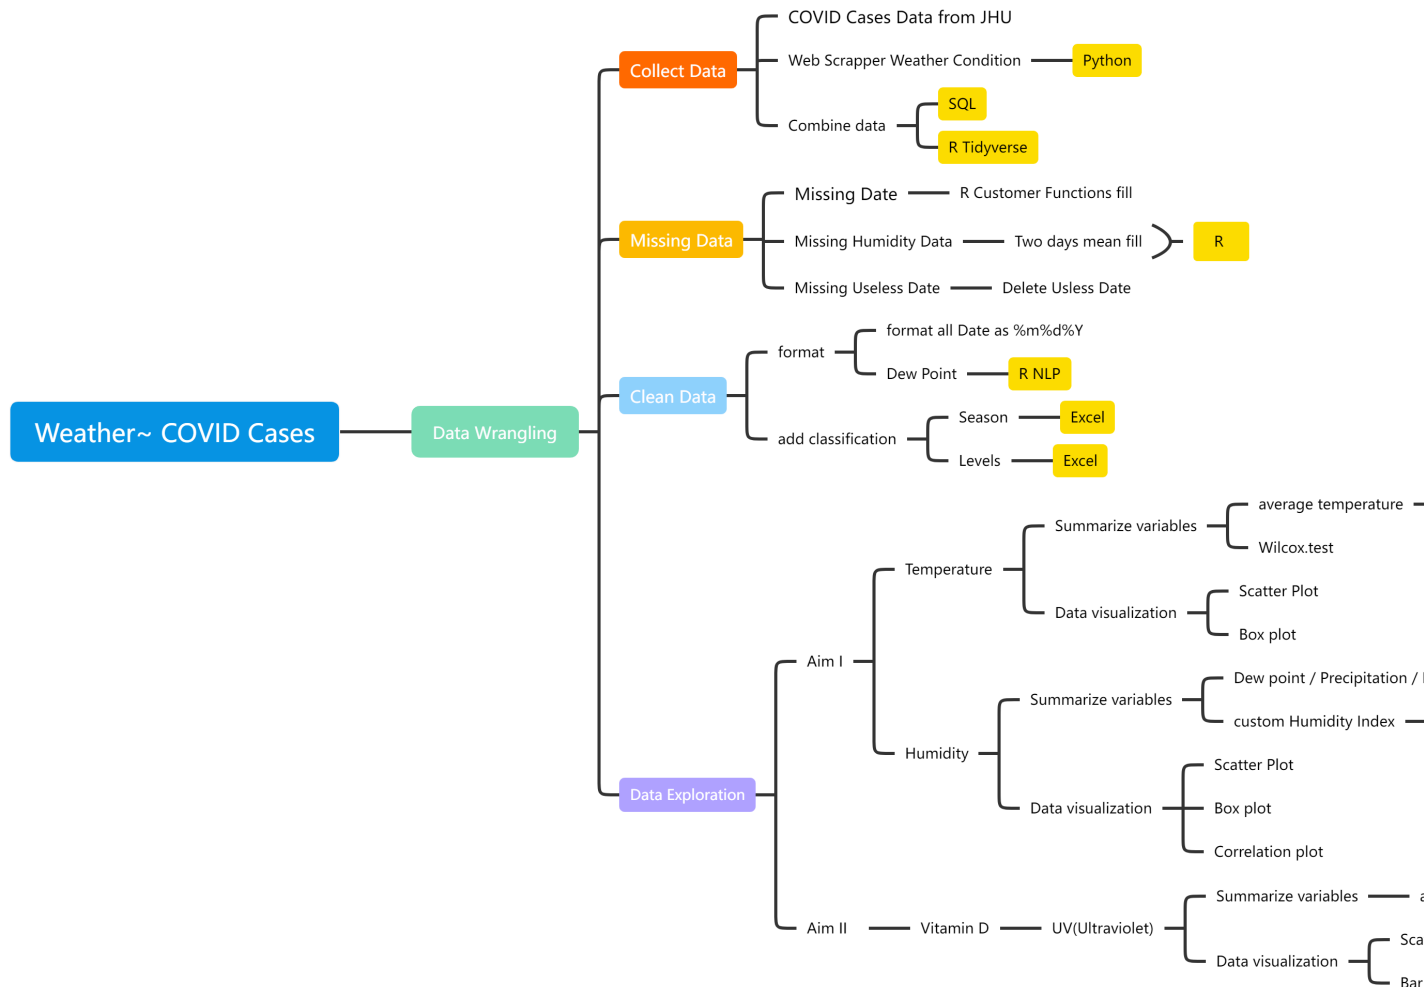

Figure 1: Highlighting the Keys to our Relational Database

Data Acquisition

1. New York City COVID-19 Data Archive

- Source: [NYC OpenData](#)
- Acquisition Method
 - Download .csv file
- Purpose:
 - We will use this time series data to track changes in the incidence of COVID-19.

2. New York City Weather Data

- Source: Weather Underground - Weather Archive
- Acquisition Method
 - Webscraping/ API Tool
- Purpose:
 - Merge time series weather data with timeseries Covid-19 data and investigate potential associations

3. Daily UV Index Scores - New York City

- Source: Central New York's Live Weather Source
- Acquisition Method
 - UV index values are presented as tables (see figure)
 - Copy tables and paste into Microsoft Excel
 - Save as .csv file
- Purpose
 - Sunlight and Vitamin-D absorbtion
 - * It is generally accepted that there is a positive association between exposure to sunlight and absorbtion of vitamin-D.
 - * It is also generally accepted that there is a positive association between vitamin-D absorbtion and immune system capacity.
 - We will us UV-Index as a proxy for exposure to sunlight at the population level and test for associations between UV Index and the incidence of Covid-19.

Relational Schema

```
knitr::include_graphics(path = "images/Relational_Schema.png")
```

Figure 2: Highlighting the Keys to our Relational Database

Data Cleaning

1. New York City COVID-19 Data Archive

2. New York City Weather Data

A. Read-in File from Raw Data File

- The raw file has an issue with the column headers.
 - Several Headers include symbols that don't work with the interpreter
 - * eg. *Low_Temp($^{\circ}F$)*, *High_Temp($^{\circ}F$)*
- **Solution:** Update column names while reading in the file!

```
# vector with acceptable column names
headers <- c("High.Temp", "Low.Temp", "Avg.Temp", "Precip", "Dew.Point", "Humidity",
            "Date", "City")

# read in the raw data file
weather.raw <- read.csv(file = "data/Raw Data/nyc_weather_raw.csv", header = TRUE,
                        col.names = headers)
```

B. Remove the “City” Variable

- Every observation is is “new york city”

```
weather.clean <- weather.raw %>%
  select(-City)
```

C. Display

```
y = weather.raw[1:5, ]
knitr::kable(x = y, digits = 2, align = "c")
```

| High.Temp | Low.Temp | Avg.Temp | Precip | Dew.Point | Humidity | Date | City |
|-----------|----------|----------|--------|-----------|----------|---------------|---------------|
| 44 | 26 | 35.46 | 0.00 | 13.67 | 41.83 | 2020/3/1 0:00 | new york city |
| 56 | 38 | 48.17 | 0.00 | 30.46 | 51.12 | 2020/3/2 | new york city |
| 58 | 48 | 52.41 | 0.01 | 44.59 | 75.47 | 2020/3/3 | new york city |
| 57 | 46 | 50.52 | 0.28 | 28.52 | 44.76 | 2020/3/4 | new york city |
| 52 | 40 | 44.75 | 0.00 | 25.38 | 48.50 | 2020/3/5 | new york city |

D. Write the Processed Data to a new .csv file

```
write.csv(x = weather.clean, file = "data/Processed Data/nyc_weather.csv")
```

3. Daily UV Index Scores - New York City
